

Secure your cards and keys...

The element of risk is a constant in the casino business. Tourists happily embrace it when they walk through the front doors. Casino operators do everything they can to minimize it.

The people who service the slot machines are called slot technicians. They use cards and keys to access them to collect the coins from inside. When not in use, these cards typically sit in a locked drawer. The person with the key to this drawer is the slot manager. Among his other duties, he's responsible for making sure these cards do not fall into the wrong hands.

The latest model in the Key Systems' family of Security Asset Managers, the Card-Key SAM, removes this risk through sophisticated key control technology that's been modified to secure cards of all sorts in metal slots that "sense" when a card is removed and returned.

Like the other SAM models, the new Card-Key SAM also:

- Produces audit trails that record and document every transaction at the SAM.
- Opens only for authorized PIN codes.
- Offers multiple access levels.
- Alarms if asset is out beyond a certain time limit.

But instead of using tamper-proof key rings to secure the card inside, like the other SAMs, the Card-Key SAM uses sleeves and keys to hold the cards in place,

Card-Key SAM's can store up to 60 cards depending on model. To remove the card, you first have to remove the key, which holds the card in place. You cannot put the key back in once the card is removed. Both key and card have to be removed and replaced together. The SAM will not accept one without the other.

The Card-Key SAM from Key Systems offers a unique brand of dual-purpose security.

"The Card-Key SAM uses sleeves and keys to hold the cards in place."
