1. Fasteners must not be driven until the concrete has reached the minimum designated compressive strength.
 2. Concrete thickness must be a minimum of three times the embedment depth.
 3. The ultimate tension and shear values are for fasteners only. Steel or wood members connected to the substrate must be investigated for compliance with the applicable code.
 4. The values listed above are ultimate load capacities which should be reduced by a factor of safety to determine the allowable working load. For allowable load capacities, see the allowable load tables.
 For allowable for the formation of the set of the substrate must be investigated for compliance with the applicable code.

Multiple fasteners are recommended for any attachment for increased reliability.

Fasteners must not be driven until the concrete has reached the minimum designated compressive strength.
 Concrete thickness must be a minimum of three times the embedment depth.

The ultimate tension and shear values are for fasteners only. Steel or wood members connected to the substrate must be investigated for compliance with the applicable code.
 The values listed above are ultimate load capacities which should be reduced by a factor of safety to determine the allowable working load. For allowable load capacities, see the allowable load tables.

5. The shear load listed is perpendicular to the flute. The shear value parallel to the flute is 2,025 lbs (9.1 kN). 6. Multiple fasteners are recommended for any attachment for increased reliability.

1. Successful fastening to the face shell of Hollow CMU is typically done with the lightest powder load level.

2. The values listed above are ultimate load capacities which should be reduced by a factor of safety to determine the allowable working load. For allowable load capacities, see the allowable load tables.

Multiple fasteners are recommended for any attachment for increased reliability.
 Concrete masonry units are typical 8 x 8 x 16 inch units meeting the requirements of ASTM C90, Grade N, lightweight block.

1. Successful fastening to the face shell of Hollow CMU is typically done with the lightest powder load level.

2. The values listed above are allowable load capacities. The values are based on minimum required factors of safety. Consideration of additional safety factors may be necessary depending on the application, such as life safety or overhead.

Multiple fasteners are recommended for any attachment for increased reliability.
 Concrete masonry units are typical 8 x 8 x 16 inch units meeting the requirements of ASTM C90, Grade N, lightweight block.

1. Tabulated allowable pullover load values were tested in accordance with ICC-ES AC70 and are based on an applied safety factor of 5.0.

Allowable pullover aspectives of sheet steel or framing member should be compared to the fastener tensile load capacities in concrete, steel and masonry to determine the controlling resistance load.
 For pins with washer assemblies, the washer thickness is 14 gage minimum.
