Aquatic Harvesters are Lawnmowers for Aquatic Plants

Aquamarine aquatic plant harvesters are hydraulically driven with reciprocating knives mounted on the harvesting head to cut the aquatic vegetation. The vegetation is then transferred onto the conveyor system located on the closed deck barge. The storage conveyors are gradually filled up with tightly packed plants and this harvested biomass is then transferred to the shoreline or into a dump truck via a shore conveyor.

Aquamarine designs, manufactures and markets aquatic harvesters in a range of sizes to meet our customers' needs.

The size of the waterway, the depth of the water, the type of weeds and the speed that it is possible to harvest at should be considered when choosing the model that is optimum for the operation. Choose from our selection of standard model options.

In addition to the standard aquatic harvesters, Aquamarine has the advanced capability to manufacture custom equipment. For more information please visit the [custom equipment](#) section.
