

Aquatic Transporters

Our transporters & hydrashuttles are a family of self-contained vessels propelled by hydraulically driven paddlewheels, outboard engine(s), an inboard/outboard diesel engine or hydraulic outboard engine(s). They are designed to move larger masses of harvested vegetation from a Harvester at the harvesting site to an onshore off-loading site.

Bow loading and unloading assures the operator of unobstructed vision at all times from the raised bridge. The front conveyor couples automatically to the Harvester in the collecting mode, and while off-loading it couples to a shore conveyor which then transfers the biomass directly into a dump truck.
