Main

When you need considerable work height combined with limited or narrow access and maybe even surface pressure restrictions, nothing outperforms the Falcon series from ReachMaster. In a field dominated by traditional boom lifts, the Falcon series sets a new standard for compact, flexible and light aerial work platform design. Available in two base models- with wheels or tracks- the FS95 (with 95 foot work height) is capable of passing through a door opening a mere 2.6 feet wide and 6.6 feet high.

Once again positioning itself as the technological market leader, the Falcon FS is the first and only compact lift to be equipped with a double 20 foot jib (2 x 10 ft.) and automatic setting of outriggers. The lift can be driven in folded position from the basket as well as outriggers can be set automatically, also from the basket. The design is not only elegant, but also makes it the most user- friendly and safe unit in its class. Standard features include our world- renowned, automatic safety- and stability system, which provides maximum safety as well as our unique multi-position outrigger system, which allows for set-up on uneven surfaces.
