This four boiler skid system was designed and manufactured by Fulton to provide humidification for an aircraft paint booth as well as building humidification for the defense aircraft manufacturing facility in the mid-west United States. The humidification package consisted of three 60 HP and one 80 HP low emission (30 PPM NO<sub>x</sub>) vertical steam boilers, feed set, blow off separator, carbon filter and water softener. All components were packaged together with single point connections.

Integral water pre-treatment and automatic blowdown systems will allow the facility to operate this system free of chemical treatment. The robust nature of the Fulton boiler in addition to Fulton's ability to design and package such a system helped make the concept of a system free of chemical treatment a reality for this customer.
