

# Cables

20

We have developed the best possible internal wiring with various types of cable in order to meet our exacting demands in terms of sound. Of course, these cables are also the best way of connecting the various devices to each other.

As it makes its way from its source via the various amplifier stages and loudspeakers to the listener, every particle of sound passes through many metres of connecting cables. The homogeneous signal path is provided by the internal wiring of CD players, pre-amplifiers, amplifiers, and loudspeakers, which is always made of the same material. The loudspeaker cables are also part of this chain and are made of the same material as the internal wiring.

Unadulterated reproduction can only be achieved using high-quality cable connections. Burmester cables are characterized by secure socket contacts and the best kind of conducting material in conjunction with a sensible internal design and particularly effective insulation.

Cables can be made specially to fit your needs and specifications. Please ask your dealer to supply genuine Burmester cables. He will be happy to assemble the right connections.
