Sound Alert™ Jackbox & Listening Center

Protecting student hearing is one of the driving factors in selecting the right audio equipment for schools and libraries. The unique warning light on this jackbox helps students learn and understand the importance of safe sound levels while they are working on their listening and speaking skills. A red light is activated when the sound through this Monaural Sound Alert Jackbox exceeds 85 decibels, notifying both students and teachers that the volume should be adjusted.

Sound Alert™ Headphone

Sometimes it's difficult to monitor the sound level of what students are listening to. But with these special stereo headphones a red warning light comes on when the sound level exceeds 85 decibels, which is the recommended volume ceiling. Research from the American Speech-Language-Hearing Association indicates that more than 40% of the time students regularly set the volume too high on their audio devices. This sound alert system keeps you from having to guess or constantly check the volume in your students' headphones.
