Switchable Stereo/Mono Wireless Headphone

Wireless devices and services are the fastest growing segment of new technology in schools today. Cloud-based technologies provide cost-effective ways for schools and districts to expand their technology offerings without breaking the budget. Optimize your student-to-computer ratio by plugging the detached USB transmitter into a computer's USB port to transmit wireless audio to an individual student or a small group. These cord-free headphones give students up to a 20' range as long as there is a clear line of sight between the transmitter and the headphone. This headphone easily switches between monaural and stereo use. Ambient noise-reducing earcups keep students focused and engaged. The headphone receives curriculum content from the transmitter built into the 2395IR boombox or 3432IR cassette player/recorder.

- HIR-KT4** Four headphones with a single transmitter (page 41) \$274
- HIR-KT1** Headphone with transmitter \$96
- HIR-HP1** Additional wireless headphone without transmitter \$57
