

WET Series

WET X

The Performance of Wood, the Protection of Fiberglass for Premier Applications

The WET X family includes thirteen models, including high output two-way 12-inch and 15-inch systems, each available with 6 rotatable horn patterns, and a powerful dual 18-inch down-firing subwoofer system. WET X represents an evolution in all-weather performance and enclosure construction. Community's exclusive fiberglass-sealed marine-grade plywood lined multi-layer composite enclosures and innovative drivers provide premium sound quality for both outdoor and indoor venues. The full-range loudspeakers offer unmatched flexibility and production-grade high output performance. Featuring a large diaphragm 1.4-inch exit high frequency compression driver, WET X loudspeakers can produce the same output levels as the largest WET II models but in enclosures nearly half the size. The low frequency cone and internal circuitry have Community's proprietary Envirotech™ coating for improved weather-resistance.

All WET X loudspeakers are available in black or white finishes, and mounting brackets for all models are included with the loudspeakers at no extra charge. Configure-to-order options include a factory-installed 400W autoformer, biamp mode operation including a 4-conductor SJOW cable, extra hang points up to 3 additional per side, custom color exterior finish based on an RAL number or a color sample, and custom length black or white cable. The combination of configure-to-order and multiple horn options, higher output, extreme weather-resistance and a powerful subwoofer brings more flexibility for providing exceptional music and speech quality to any outdoor or multipurpose application. WET X provides theatrical quality sound and intelligibility in an aesthetically pleasing contemporary enclosure suitable for outdoor direct exposure and for permanent installations in all environments.
