

Integrated Amps

15

»This amplifier wields its seemingly limitless power in a very cultivated manner, and in fact with a great deal of charm.«

HIFI & RECORDS

Burmester integrated amplifiers take their bearings from its preamplifiers and power amplifiers, many of which have been accorded international awards. They are equipped with the proven X-Amp amplifier technology and a tone control system that can be deactivated, and like all

Burmester amplifiers are symmetrically constructed and are entirely DC-coupled. Burmester integrated amplifiers operate in a stable way even when they are driving loudspeakers with critical impedance levels. They have a distinctively warm, strong and full-bodied sound and at the

same time impress the listener with a wealth of details. Also, like all other Burmester amplifiers, these integrated amplifiers are carefully made by hand in the factory in Berlin and subjected to comprehensive testing before being sent to the customer.

032 INTEGRATED AMP CLASSIC LINE

On account of its sizeable 650 VA power supply unit, the 032 has no difficulty in maintaining a constant high current supply and is thus able to power large loudspeakers with

very low impedance values and very complex loads. It is exceptionally well equipped for home cinemas on account of its Home Theater Throughput system, which permits signals to

bypass the preamplifier stage and to be sent directly to the amplifier.

082 INTEGRATED AMP CLASSIC LINE

In spite of the fact that the power supply unit is slightly smaller than in the case of 032, 082 still delivers an impressive performance, and the sound quality is almost on a par with that of the more powerful 032.

It is an ideal partner for Burmester CD players, and in particular for Classic Line 061. The 082 amplifier also makes our listening dreams come true. It exudes a warm, strong and full-bodied sound that at the

same time impresses the listener on account of its capacity for detail. We attain this goal with a type of circuit design that is based on symmetrical DC-coupled amplifier paths.

101 INTEGRATED AMP CLASSIC LINE

The 101 Integrated Amplifier is the latest integrated amplifier in the Burmester product range and a supreme example for the perfect combination of efficient class D power sections and an analogue power supply. With its power reserves thus made available the 101 easily achieves in a compact design

the warm and well-balanced sound which is known to be a trademark of the Burmester tone. The switchable "Smooth" function produces a pleasant and at the same time detailed sound image even with low volume levels.

Within the Burmester sound world the 101 integrated amplifier

commends itself as a perfect game partner for the 102 CD player, notably when combined with the loudspeakers from the Burmester portfolio. The additional balanced outputs also allow to use it as a dedicated preamp or for bi-amping .
