

# model GATEKEEPER

GateKeeper is Alvarado's popular gate control and monitoring software for the Supervisor line of optical turnstiles. The TCP/IP-based application controls and monitors Alvarado optical turnstiles, replacing cumbersome switchboard control panels.

The application allows control of virtually all day-to-day operational functions, including designating a passage lane as entry or exit, opening or closing a lane and allowing passage overrides. GateKeeper also provides immediate visual and audio notification of alarm conditions - identifying the turnstile, the time of alarm and the alarm condition.

The application allows authorized personnel to easily configure turnstile settings, such as alarm types and duration, turnstile reset times (if a badge is scanned but no one passes), and tailgate sensitivity.

GateKeeper also includes an Event Scheduler which allows automation of turnstile configuration changes. Intuitive templates are provided to automate the changing of turnstile states (e.g., turn all turnstiles to free exit at 5:00 p.m. Monday-Friday; close turnstile #2 & 4 on weekends and holidays).

## Key Features

- TCP/IP communication
- Immediate visibility of alarm conditions
- Automated configuration changes /event management
- Database log of all turnstile activity
- PC-based software can run on desktops, laptops and can be accessed by iPads
