

Aquatic Transporters

Our aquatic transporters are a family of self contained vessels propelled by heavy duty, high performance outboard motors (alternately, hydraulically powered propellers are available).

Aquamarine transporters are designed to multiply productivity of one or more aquatic harvester(s) depending on aquatic plant density and transport distance to shore.

Below: Aquatic transporters with front loading and unloading storage system – click on thumbnail images for slideshow view.

Aquamarine Transport Barge

Aquatic transporter with feed through storage conveyor unloading system (bow to stern).
