

Emerging community health concerns require adding patient capacity by constructing temporary facilities. These facilities need backup power systems that can be obtained and installed quickly.

Each facility needs to connect to a generator when utility outages occur. This requires a transfer switch together with means to connect it to a generator and monitor its status.

Generators can be connected to ASCO Transfer Switches directly, or through Quick Connect Panels to speed installation. Annunciators monitor status and provide web pages for remote monitoring and control. Options for indoor, outdoor, and multi-generator applications are available.

For more information, review the documents below and contact an ASCO representative.
