A single 3-way can replace several 2-way's. Flow may be mixed, diverted, or shut off. With side entry 3-ways there is always mixing when switching positions, which facilitates switching between safety devices or pumps.

Seat Tightness Note: If closed port pressure exceeds open port pressure, the ball may be forced slightly off the seat in some port configurations / ball positions. This would allow a small amount of mixing from all ports, which may or may not be a problem, depending upon sensitivity of process to mixing. Occurrence may vary depending upon flow and ambient conditions.
